

AuthenTick

PS ID : Cybersecurity & Digital Trust

Solution Name : AuthenTick

Team Name : Dominion

College Name : Thapar Institute of Engineering and
Technology, Patiala

Team Leader Name : Ishaan Jain

IDEA

IDEA / SOLUTION:

A **Blockchain-based Product Ownership Management System** for real-time anti-counterfeit detection after the sale. Counterfeits are about 2.5% of world trade (OECD/EUIPO).

NFT-based Digital Twin: each serialized product is an ERC-721 token. Its ID is derived from GTIN + serial, so a serial can only ever be minted once.

GS1 EPCIS event trail: every handoff is logged with who, what, when and where; the registry anchors only the coarse stage on-chain.

Wallet-signed ownership proof: the owner signs a single-use challenge; no private data is revealed. zk-SNARK privacy proofs are on the roadmap.

Scan to verify: anyone scans the QR code and sees authenticity, provenance and a clone-risk score in seconds.

Lifecycle: off-chain EPCIS step, then on-chain stage

A sold item is final. The chain refuses skipped steps and revoked products.

Problem Resolution:

- **Eliminates duplicate serial number fraud** via cryptographic ownership enforcement
- **Prevents post-supply-chain counterfeit entry** through immutable tracking
- **Keeps sensitive data off-chain:** only coarse lifecycle stages are anchored, event details stay in EPCIS records
- **Removes data silos** with one verification layer shared by manufacturers, distributors, retailers and buyers

Unique Value Propositions (UVP):

Digital twin per item using ERC-721 NFTs on smart contracts

Tamper-proof lifecycle ledger with role-based access

Interoperable via GS1 EPCIS and GTIN check-digit validation

Works today: live app, demo token 0xde70a11ce0000001, no wallet needed

Clone detection: every scan is scored for copy-like patterns, so a photocopied label is flagged

Engineered to ship: open source (MIT), 88 unit + 11 browser tests, CI on every change

Live Deployed Product: <https://authen-tick-web.vercel.app>

Technical Approach

Github Repository (Documentation and code) : <https://github.com/Phantom8420/AuthenTick>

Ownership & Verification Flow

AuthenTick: blockchain-based product ownership management

Product Status:

Built, deployed and tested: contracts, API and web app are complete and the app is live. A full product life (mint to sale, plus clone and revoke checks) runs against a real local chain in CI. Next: testnet deployment, zk-SNARK proofs, tamper-proof tags.

Algorithm Development:

Ownership and lifecycle logic in smart contracts: an **ERC-721 NFT** per product (ID = keccak256 of GTIN + serial) and an **OwnershipRegistry** that only moves forward one role-checked step at a time.

Application Development: React web app (QR scan, verify, mint, supply-chain timeline) on an Express + MongoDB API for **manufacturers, distributors, retailers and customers**. A built-in demo mode needs no backend.

Encryption and Security: Wallet sign-in with **single-use signed challenges**, httpOnly sessions with CSRF protection, role-based access, rate limiting, signed ownership proofs and scan-anomaly clone detection. zk-SNARKs and PUF tags are planned.

Cloud / System Infrastructure:

Blockchain Platform: Ethereum-compatible (Hardhat, OpenZeppelin, ethers)

Messaging Standard: GS1 EPCIS for supply-chain events

Deployment: Docker and Vercel; GitHub Actions CI (unit, end-to-end, accessibility, Slither)

Security Model

Threats and defences:

- **Cloned serial number:** token ID is derived from GTIN + serial; a second mint is rejected by the contract
- **Photocopied QR label:** scans are scored for copy-like patterns and flagged as a likely clone
- **Replayed signature:** challenges are single use and expire in 5 minutes
- **Stolen session, CSRF:** httpOnly cookie plus an anti-CSRF header on every write
- **Role abuse:** roles enforced in the API and the contracts; stages move one step at a time
- **Recalled product:** revoking it freezes it on-chain, so no further stage can be recorded
- **Data exposure:** only coarse stages on-chain; scan sources stored as hashed networks, never IPs

Measured, not claimed:

Gas per on-chain action (a CI test fails if it rises)

Mint (ERC-721)	196k
Stage 1: Minted	64k
Stage 2: Distribution	47k
Stage 3: At retail	47k
Stage 4: Consumer	47k
Revoke	40k

Whole on-chain life (mint + 4 stages): about 400k gas

- **Tests:** 88 unit and 11 browser tests (demo journey, clone flag, accessibility)
- **Checks:** Slither, a real-chain smoke test, CI on every change

Clone detection (anomaly scoring):

A genuine label is read in a few places; a copy shows up everywhere. We log each lookup as a hashed network, score the distinct networks per 24 hours (stricter once sold) and scan bursts, and flag high scores as a likely clone.

Not a black box. Try Simulate a cloned label on the demo item.

Live product : authen-tick-web.vercel.app

Feasibility and Impact

Feasibility Analysis

Technical: Built and tested end to end. Measured: about 400k gas for a product's whole on-chain life.

Financial: Low running cost. Brands pay per mint or subscribe.

Market: Pharma, luxury, electronics. Unlike MediLedger or VeChain: open source, buyer-side checks, live demo.

Operational: Open standards (GS1 EPCIS, ERC-721) fit existing systems.

Challenges & Risks

Technical: Gas fees; the relayer is a trust point; contracts not yet independently audited.

Financial: Implementation and onboarding cost for manufacturers.

Market: Slow industry adoption, resistance to change.

Operational: Linking the item to its token relies on label integrity; data silos.

Mitigation Strategies

Technical: Layer-2 deployment, batch anchoring, independent audit, zk-SNARK proofs.

Financial: Consortium cost-sharing; pay-per-mint model.

Market: Start with one sector pilot; industry partnerships.

Operational: Standardize on GS1 EPCIS, phased rollout, tamper-evident NFC/PUF tags.

Target Impact

Trust: Verified product authenticity

Safety: Eliminates counterfeit risks

Economic: Reduces fraud losses

Access: Transparent resale markets

Solution Benefits

Social

Consumer trust

Safer products

Transparency

Economic

Fraud reduction

Cost efficiency

Market expansion

Environmental

Reduced waste

Efficient tracking

Optimized logistics
